Authentication Server Release Notes

VERSION 2.6.1

1. Introduction

This document describes the changes and enhancements to the FireID Authentication Server Version 2.6.1.

2. New Features

2.1 Active Directory & RADIUS Passthrough

Issue	Area	Subject
US818	Authentication	Active Directory & RADIUS Passthrough
<p>The FireID authentication server now supports Active Directory and RADIUS passthrough. Authentication requests with static passwords will be forwarded to the specified Active Directory or RADIUS server if the static password is not set for the user. Only users present on the FireID authentication server will be authenticated using the passthrough functionality. If passthrough authentication is enabled and a static password set, then the authentication request will override the passthrough setting and authenticate the user on the FireID authentication server.</p> <p>To use an Active Directory as an external authentication provider, it must first be specified as a Data Source under the System Configuration tab.</p>		

2.2 User Management: CSV File Import

Issue	Area	Subject
US1122	User Management	User Management: CSV File Import
<p>Systems administrators can now import users into the authentication server by importing a CSV file via the User Import functionality. It should be noted that only data in a specific format will be imported, and the user must conform to the following standard:</p> <ul style="list-style-type: none"> • No headers • No quotes • Comma-separated values • Empty values denoted by ',' • Values in the following order: username, firstName, lastName, email, cellphone number 		

3. Known Issues

There are no known issues in the version.
